QUANTITATIVE VALUES

APPROACH

- Let's start with two attributes:
country & income per person

Country	Income per person
Afghanistan	850
France	29500
US	41000

1. FIND A LAYOUT

Country	Income per person
Afghanistan	850
France	29500
US	41000

2. CHOOSE A VISUAL ENCODING & MARK

E.g. position + circle

1. FIND A LAYOUT

Country	Income per person	Life expectancy
Afghanistan	850	57
France	29500	81
US	41000	78

How do we extend this to 3 data attributes?

1. FIND A LAYOUT

Country	Income per person	Life expectancy
Afghanistan	850	57
France	29500	81
US	41000	78

SCATTERPLOTS

- two quantitative values
- horizontal and vertical spatial dimensions
- mark type = point

Life expectancy, years ?

Color World Regions ?

OPTIONS EXPAND PRESENT

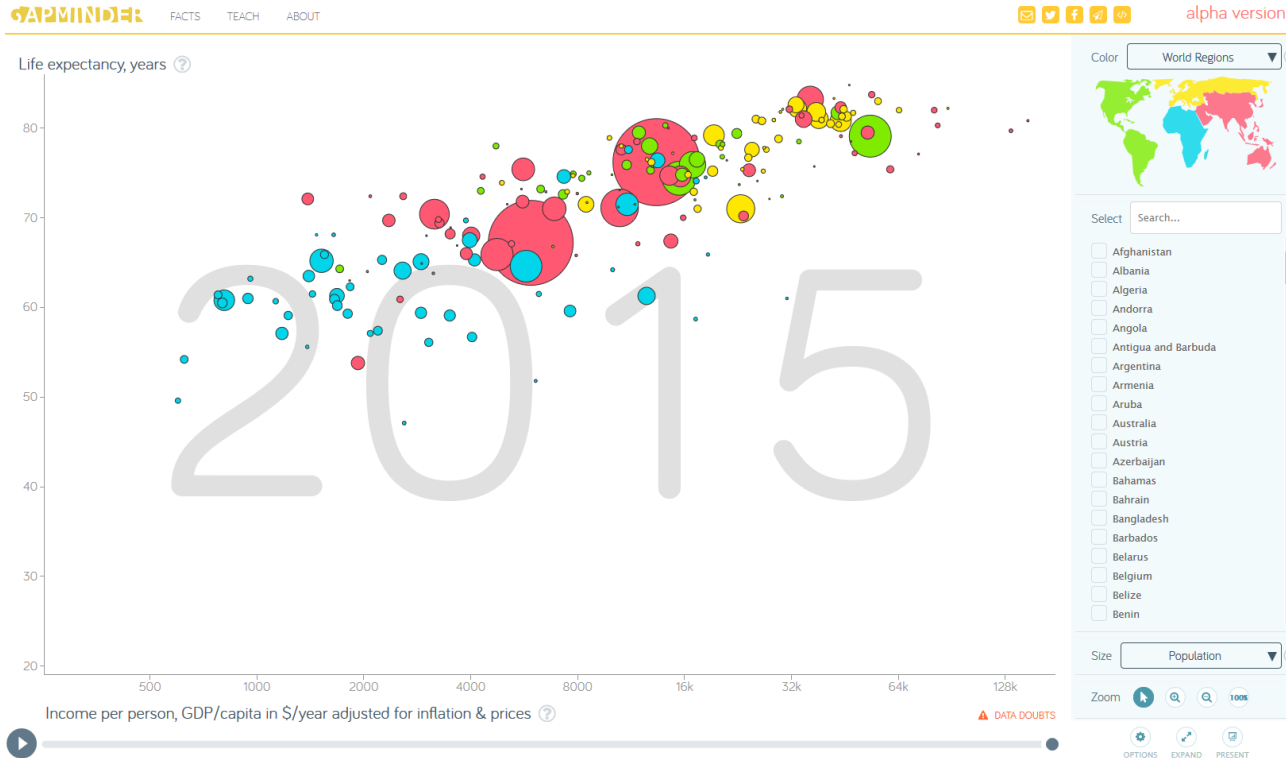

when marks are sized, the chart is often called a bubble chart or bubble plot

TASKS

- find trends
- find outliers
- show distribution
- show correlation
- locate clusters

how many items are reasonable to put on a scatterplot?

GLYPHS

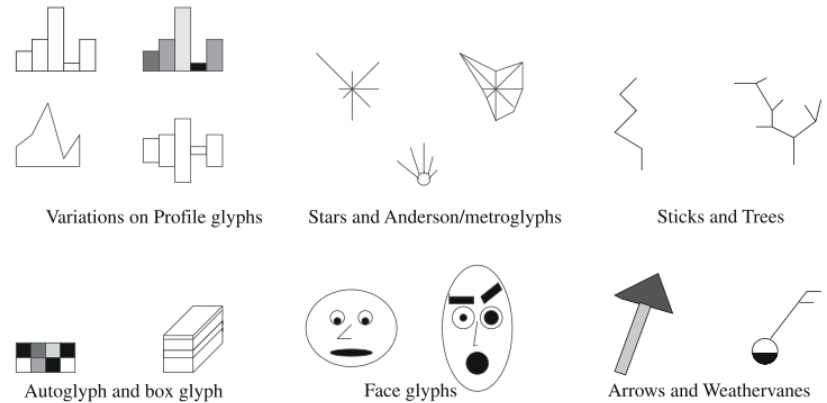

marks can be replaced with glyphs

glyphs are themselves composed of multiple marks

GLYPHS

- Small composite visual representations of multi-dimensional data points
- Characterized generally by lack of reference structures (grid lines, axes labels, ...)

From Ward, 2002

A taxonomy of glyph placement strategies for multidimensional data visualization

EXAMPLE: CHERNOFF FACES

AARONSON, L.H.

ALEXANDER, J.M.

ARMENTANO, A.J.

BERDON, R.I.

BRACKEN, J.J.

BURNS, E.B.

CALLAHAN, R.J.

COHEN, S.S.

DEAN, H.H.

DEVITA, H.J.

Image source: Wikipedia

Herman Chernoff, [The Use of Faces to Represent Points in K-Dimensional Space Graphically](#), 1973.

CHERNOFF FACES

- features of a human face encode data values (e.g. slant of eye brows, size of eyes, ...)
- reasoning: humans are good at differentiating faces and reading face features
- problem: chernoff faces have generally been found not to be very effective

EXAMPLE: STAR GLYPHS

- Lay out dimension in radial fashion
- Draw each point as a ring

(not real data, here)

STAR GLYPHS

SHOW CATEGORICAL REGIONS

Separate, Order, and Align

CATEGORICAL VALUES

- spatial position is an ordered magnitude visual channel
- categorical attributes are unordered identities (no magnitude)
- cannot be encoded with spatial position
- BUT: can be differentiated with a spatial region

REGIONS

- contiguous bounded areas
- distinct from one another
- need to be separated, ordered, and aligned

LIST ALIGNMENT

ONE KEY

LIST ALIGNMENT

separate into regions by key

E.g. length + rectangle

ALIGN

align regions of key categorical values along one axis in a common frame

ORDER

- using a derived attribute such as alphabet
- and/or using dependent data values

BAR CHARTS

DATA	one quantitative value attribute, one categorical key attribute
ENCODE	line marks, express value attribute with aligned vertical position (length), separate key attribute with horizontal position
TASK	lookup and compare values
SCALE	key attribute: dozens to hundreds of levels

ALTERNATIVE

<https://www.ec.gc.ca/indicateurs-indicators/default.asp?lang=en&n=1BCD421B-1>

Stacked bar chart

- each bar is a composite glyph
- each bar part encodes a value
- composite glyphs arranged as a list according to primary key
- color used to distinguish secondary key
- typically used for absolute values (use a normalized stacked bar for proportions)

STACKED BARS VS. NORMALIZED STACKED BARS

STACKED BARS

- ADVANTAGE
 - can compare totals and lowest level well
- DISADVANTAGE
 - upper levels of secondary key require comparison against non-aligned scale

STACKED BARS

DATA	MD table; one quantitative value attribute, two categorical key attributes
ENCODE	bar glyph: length-encoded subcomponents for each level of secondary key attribute separate bars by category of primary key
TASK	part-to-whole relationship, lookup values, find trends
SCALE	key attribute (main axis): dozens to hundreds of levels key attribute (stacked glyph axis): several to one dozen

Parallel Coordinates

parallel coordinates

- show correlations between neighboring axes

MULTIDIMENSIONAL DETECTIVE

Alfred Inselberg*, Multidimensional Graphs Ltd[†]
&
Computer Science Department
Tel Aviv University, Israel
aiisreal@math.tau.ac.il

Abstract

The display of multivariate datasets in parallel coordinates, transforms the search for *relations* among the variables into a 2-D pattern recognition problem. This is the basis for the application to *Visual Data Mining*. The Knowledge Discovery process together with some general guidelines are illustrated on a dataset from the production of a VLSI chip. The special strength of parallel coordinates is in modeling **relations**. As an example, a simplified Economic Model is constructed with data from various economic sectors of a real country. The visual model shows the interrelationship and dependencies between the sectors, circumstances where there is competition for the same resource, and feasible economic policies. Interactively, the model can be used to do trade-off analyses, discover sensitivities, do approximate optimization, monitor (as in a Process) and Decision Support.

Introduction

In Geometry parallelism, which does not require a notion of angle, rather than orthogonality is the more fundamental concept. This, together with the fact that orthogonality "uses-up" the plane very

fast, was the inspiration in 1959 for "Parallel" Coordinates. The systematic development began in 1977 [4]. The goals of the program were and still are (see [6] and [5] for short reviews) the visualization of multivariate/multidimensional problems without loss of information and having the properties:

1. Low representational complexity. Since the number of axes, N equals the number of dimensions (variables) the complexity is $O(N)$,
2. Works for any N ,
3. Every variable is treated uniformly (unlike "Chernoff Faces" and various types of "glyphs"),
4. The displayed object can be recognized under projective transformations (i.e. rotation, translation, scaling, perspective),
5. The display easily/intuitively conveys information on the properties of the N -dimensional object it represents,
6. The methodology is based on rigorous mathematical and algorithmic results.

Parallel coordinates (abbr.||-coords) transform multivariate relations into 2-D patterns, a property that is well suited for Visual Data Mining.

THE ORDER OF AXES MATTERS

Eurographics 2013, STAR Report
J. Heinrich, D. Weiskopf

REDUCE CLUTTER - HIGHLIGHT CLUSTERS

Lots of work on this. For example:

(a) A linear transfer function has been applied to the high-precision texture in order to prevent cluttering and to provide overview of the data. (b) A logarithmic transfer function is applied to a selected cluster. The structure is preserved and emphasis is put on the low density regions.

(c) Local cluster outliers are enhanced. A square root transfer function is used and the outliers are visible even through high-density regions. (d) A complementary view of the clusters with uniform bands. 'Feature animation' presents statistics about the clusters and acts as a guidance.

STAR – State of The Art Report

State of the Art of Parallel Coordinates

J. Heinrich and D. Weiskopf

Visualization Research Center, University of Stuttgart

Figure 1: Taxonomy of topics for parallel coordinates in the scientific literature. The first-level nodes each represent a section in this paper, where the scope and definition of each topic will be explained.

Abstract

This work presents a survey of the current state of the art of visualization techniques for parallel coordinates. It covers geometric models for constructing parallel coordinates and reviews methods for creating and understanding visual representations of parallel coordinates. The classification of these methods is based on a taxonomy that was established from the literature and is aimed at guiding researchers to find existing techniques and identifying white spots that require further research. The techniques covered in this survey are further related to an established taxonomy of knowledge-discovery tasks to support users of parallel coordinates in choosing a technique for their problem at hand. Finally, we discuss the challenges in constructing and understanding parallel-coordinates plots and provide some examples from different application domains.

The Jumping Off Points: Moves That Will Be Made in the Free Skating Programs

TRIPLE AXEL: Add an extra half-spin

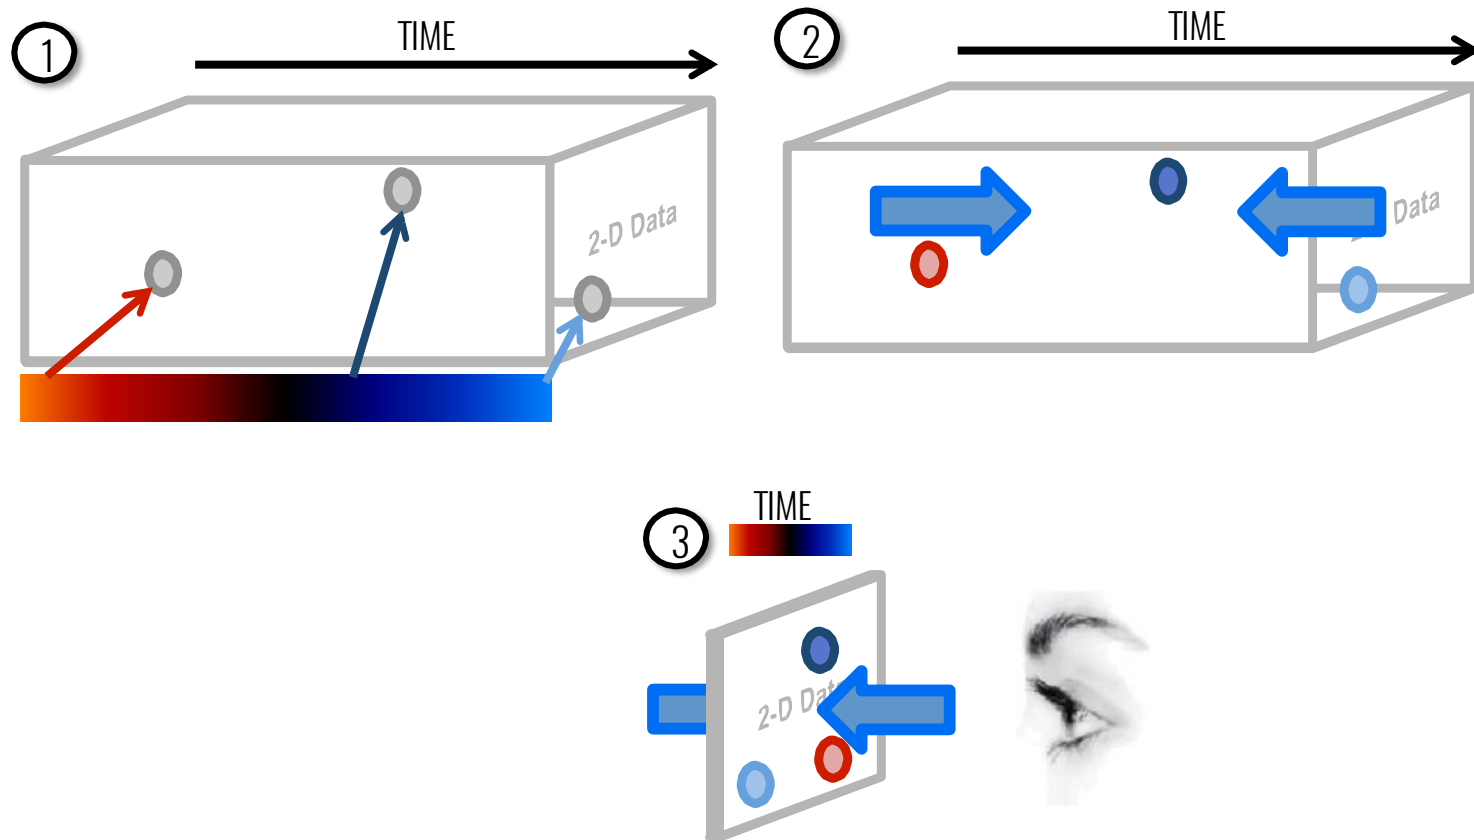

The axel's forward takeoff and backward landing positions add an extra half-rotation to the jump, so skaters need maximum power on takeoff, and precise upper body control during rotation. Once airborne, the skater gauges her speed and height to judge the number of rotations possible – she has less than one second to complete them, and must make the extra half-spin to land correctly. Only Midori Ito and Tonya Harding have landed this in competition.

SKATING THE EDGES: An overhead view of the axel

In skating terminology, the path of a jump is described as a series of edges – semicircular arcs that follow the path of the skate blade. The diagram shows the preparatory, takeoff and landing edges of an axel jump. The loop at center represents one midair rotation.

MUYBRIDGE.

AUTOMATIC ELECTRO-PHOTOGRAPH

Patent for apparatus applied for. "SALLIE GARDNER," owned by LELAND STANFORD; ridden by G. DOMM, running at a 1.40 gait over the Palo Alto track, 19th June, 1878.

The negatives of these photographs were made at intervals of twenty-seven inches of distance, and about the twenty-fifth part of a second of time; they illustrate consecutive positions assumed during a single stride of the mare. The vertical lines were twenty-seven inches apart; the horizontal lines represent elevations of four inches each. The negatives were each exposed during the two-thousandth part of a second, and are absolutely "unstitched."

Timeline Storyteller is an open-source expressive visual storytelling environment for presenting timelines in the browser or in Microsoft Power BI.

Use it to present different aspects of timeline data using a palette of timeline representations, scales, and layouts, as well as controls for filtering, highlighting, and annotation.
