DATA INTEGRATION ERRORS

DATA OFTEN COMES FROM MULTIPLE SOURCES

SCHEMAS CHANGE OVER TIME

DATA IS OFTEN COERCED FROM
ONE TYPE TO ANOTHER

CAN LEAD TO DATA LOSS,
DUPLICATION, AND OTHER

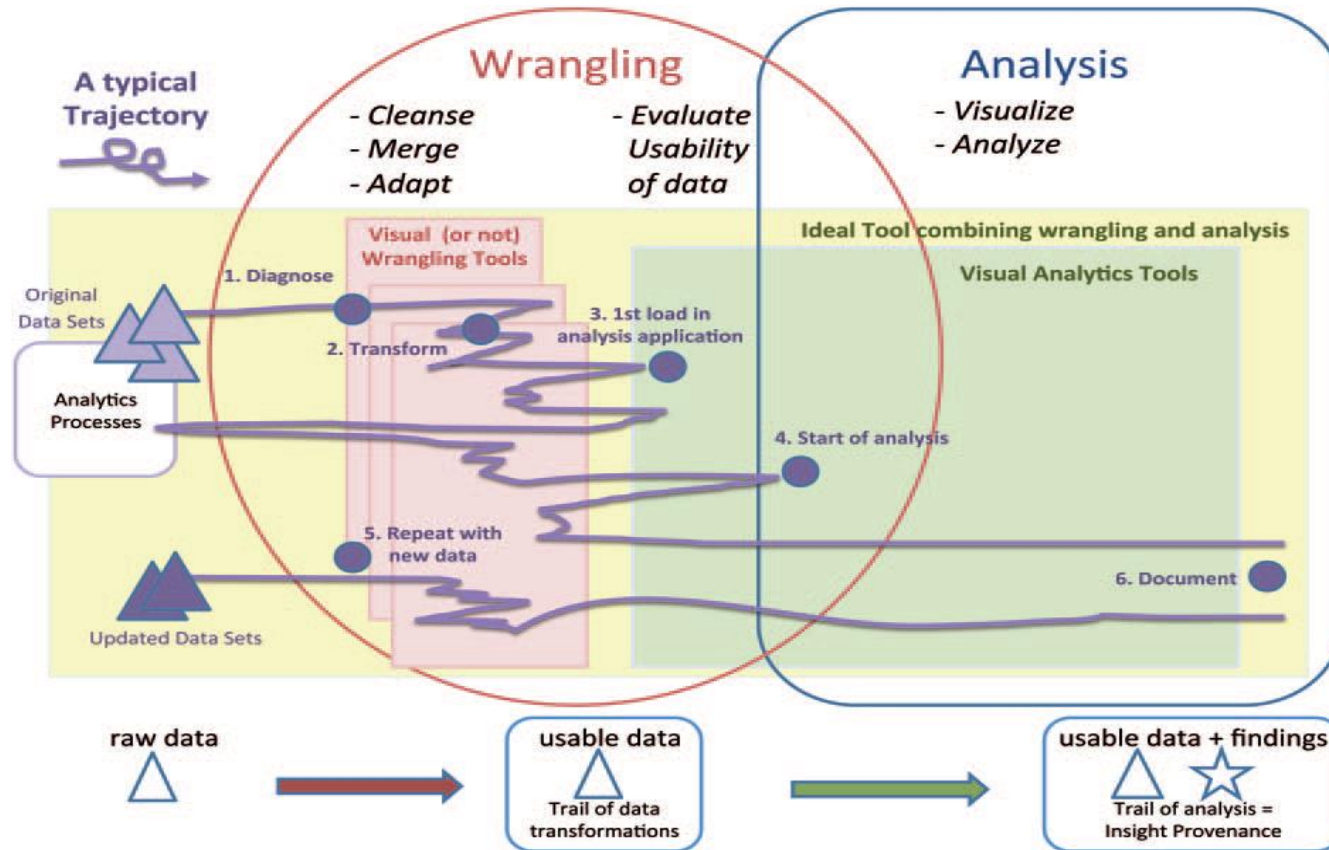

WHY IS THIS IMPORTANT?

MOST OF THE TIME IN THE DATA ANALYSIS PROCESS IS ACTUALLY SPENT HERE!

“I spend more than half my time integrating, cleansing, and transforming data without doing any actual analysis. Most of the time I’m lucky if I get to do any ‘analysis’ at all.”

[Kandel 2012]

The screenshot displays the 'National Aids Control Programme CTC2 Database' interface. At the top, the title 'National Aids Control Programme' is in red, with 'CTC2 Database' below it. The left sidebar features the coat of arms of Tanzania and the text 'The United Republic of Tanzania', along with buttons for 'Home', 'Log off', and 'Exit Database'. The main area is titled 'Patient Registration' and contains a form with several sections. At the top of the form are four buttons: 'Register new patient', 'Search patients', 'Show all patients', and 'Delete patient'. The form fields are organized into columns. The first column includes 'Patient ID:', 'File Reference:', 'First Name(s):', 'Surname:', 'Sex:', 'Date of Birth:' (with a 'or Age' link), 'Age:', 'Marital Status:', 'Phone/contact details:', 'Date of first positive HIV test:', 'Date confirmed HIV positive:', and 'Referred from:'. The second column includes 'Region:', 'District: (Wilaya)', 'Division: (Tarafa)', 'Ward: (Kata)', 'Village / Mtaa (Mtaa au Kijiji)', 'Chairperson: (Mwenyekiti wa Kijiji)', 'Ten Cell Leader: (Mjumbe/Balozi)', and 'Ten Cell LeaderContact:'. The third column includes 'Household Head: (Mkuu wa Kaya)', 'Household Head contact details:', 'Helper / treatment supporter: (Jina la Msaidizi wa karibu)', 'Helper / treatment supporter contact details:', 'Community Support Organisation / Group:', 'Drug Allergies:', 'Prior Exposure:', and 'Notes:'. A red 'Add / Edit Village or chairperson' button is located between the second and third columns. At the bottom right, there are buttons for 'Patient classification', 'Family information', and a 'Return' button with a back arrow icon.

MOVIE INFO
Every year in the ruins of what was once North America, a Panem forces each of its twelve districts to send a teenage Hunger Games. A twisted punishment for a past uprising, it's a fight for survival. The Hunger Games are a nationally telecast fight with one another until one survivor remains. Pitted against all the other districts, the Hunger Games are a nationally telecast fight with one another until one survivor remains. Pitted against all the other districts, the Hunger Games are a nationally telecast fight with one another until one survivor remains.

“Quantitative Data Cleaning for Large Databases”

Hellerstein (2008)

Quantitative Data Cleaning for Large Databases

Joseph M. Hellerstein^{*}
EECS Computer Science Division
UC Berkeley
<http://db.cs.berkeley.edu/jmh>
February 27, 2008

1 Introduction

Data collection has become a ubiquitous function of large organizations – not only for record keeping, but to support a variety of data analysis tasks that are critical to the organizational mission. Data analysis typically drives decision-making processes and efficiency optimizations, and in an increasing number of settings is the source of *direct* or *indirect* revenue or profits.

Despite the importance of data collection and analysis, data quality remains a pervasive and thereby problem in almost every large organization. The presence of incorrect or inconsistent data can significantly distort the results of analyses, often negating the potential benefits of information-driven approaches. As a result, there has been a variety of research over the last decade on various aspects of data cleaning: computational procedures to automatically or semi-automatically identify – and, when possible, correct – errors in large data sets.

In this report, we survey data cleaning methods that focus on errors in quantitative attributes of large databases, though we also provide references to data cleaning methods for other types of attributes. The discussion is targeted at computer practitioners who manage large databases of quantitative information, and designers developing data entry and auditing tools for end users. Because of our focus on quantitative data, we take a statistical view of data quality, with an emphasis on intuitive outlier detection and exploratory data analysis methods based in robust statistics [Hampel and Leroy, 1987; Hampel et al., 1986; Huber, 1981]. In addition, we review algorithms and implementations that can be easily and efficiently implemented in very large databases, and which are easy to understand and visualize graphically. The discussion mixes statistical notations and methods, algorithmic building blocks, efficient relational database implementation strategies, and user interface considerations. Throughout the discussion, references are provided for deeper reading on all of these issues.

1.1 Sources of Error in Data

Before a data item ends up in a database, it typically passes through a number of steps involving both human interaction and computation. Data errors can creep in at every step of the process from initial data acquisition to archival storage. An understanding of the sources of data errors can be useful both in designing data collection and retention techniques that mitigate

A Dialogue Between the Bureau of Justice Statistics and Key Criminal Justice Data Users

In 2008 the Bureau of Justice Statistics (BJS) convened a multi-disciplinary workshop for professionals who use justice statistics. Participants and representatives from academia, court systems, victim advocacy, and law enforcement communities provided feedback about how they use BJS statistical information and recommended ways BJS could optimize the value of data it collects and publishes. [A Dialogue Between BJS and Key Criminal Justice Data Users](#) is now available.

Announcements

BJS Visiting Fellows

Lynn A. Addington, Ph.D., Janet L. Lauritsen, Ph.D., and Avinash Bhati, Ph.D., are Visiting Fellows at the Bureau of Justice Statistics (BJS). They will conduct research designed to enhance the analytical approach and usability of specific BJS data collections. Visit the [BJS Fellows page](#) for additional information about Professor Addington, Professor Lauritsen, Mr. Bhati, and the BJS Visiting Fellows Program.

Data Analysis Tools

Data Online

Dynamic interface that allows users to construct and download custom tables.

Crime and Justice Electronic

Data Abstract spreadsheets
Aggregated data from a wide variety of published sources, intended for analytic use.

Federal Criminal Case

Processing Statistics - FCCPS
The Federal Criminal Case Processing Statistics (FCCPS) tool permits an on-line analysis of suspects and defendants processed across stages of the Federal criminal justice system.

DATA CLEANING IN GOOGLE REFINE

The screenshot displays the Google Refine web application interface. The browser window title is "Movies Analysis - Google Refine". The address bar shows "127.0.0.1:3333/project?". The main header includes the Google Refine logo, the project name "Movies Analysis", and buttons for "Open...", "Export", and "Help". Below the header, a blue bar indicates "69 matching records (448 total)". The left sidebar contains a "Facet / Filter" section with a histogram for "ReleaseDate" and a "Numeric" checkbox. The main area shows a table of data with columns for movie titles, release dates, and other attributes. Two large yellow boxes with black arrows are overlaid on the interface. The first box, labeled "FILTER", points to the "Facet / Filter" section. The second box, labeled "TRANSFORM", points to the main data table. A link "Google Refine Intro Video" is visible at the bottom right.

Quantitative Data Cleaning for Large Databases

Joseph M. Hellerstein*
EECS Computer Science Division

February 27, 2008

1 Introduction

Data collection has become a ubiquitous function of large organizations – not only for record keeping, but to support a variety of data analysis tasks that are critical to the organizational mission. Data analysis typically drives decision-making processes and efficiency optimizations, and in an increasing number of settings is the *raison d'être* of entire agencies or firms.

Despite the importance of data collection and analysis, data *quality* remains a pervasive and thorny problem in almost every large organization. The presence of incorrect or inconsistent data can significantly distort the results of analyses, often negating the potential benefits of information-driven approaches. As a result, there has been a variety of research over the last decades on various aspects of *data cleaning*: computational procedures to automatically or semi-automatically identify – and, when possible, correct – errors in large data sets.

In this report, we survey data cleaning methods that focus on errors in *quantitative* attributes of large databases, though we also provide references to data cleaning methods for other types of attributes. The discussion is targeted at computer practitioners who manage large databases of quantitative information, and designers developing data entry and auditing tools for end users. Because of our focus on quantitative data, we take a statistical view of data quality, with an emphasis on intuitive outlier detection and exploratory data analysis methods based in *robust statistics* [Rousseeuw and Leroy, 1987, Hampel et al., 1986, Huber, 1981]. In addition, we stress algorithms and implementations that can be easily and efficiently implemented in very large databases, and which are easy to understand and visualize graphically. The discussion mixes statistical intuitions and methods, algorithmic building blocks, efficient relational database implementation strategies, and user interface considerations. Throughout the discussion, references are provided for deeper reading on all of these issues.

1.1 Sources of Error in Data

Before a data item ends up in a database, it typically passes through a number of steps involving both human interaction and computation. Data errors can creep in at every step of the process from initial data acquisition to archival storage. An understanding of the sources of data errors can be useful both in designing data collection and curation techniques that mitigate

TIDY DATA PRINCIPLES

Tidy Data

Hadley Wickham
RStudio

Abstract

A huge amount of effort is spent cleaning data to get it ready for analysis, but there has been little research on how to make data cleaning as easy and effective as possible. This paper tackles a small, but important, component of data cleaning: data tidying. Tidy datasets are easy to manipulate, model and visualise, and have a specific structure: each variable is a column, each observation is a row, and each type of observational unit is a table. This framework makes it easy to tidy messy datasets because only a small set of tools are needed to deal with a wide range of un-tidy datasets. This structure also makes it easier to develop tidy tools for data analysis, tools that both input and output tidy datasets. The advantages of a consistent data structure and matching tools are demonstrated with a case study free from mundane data manipulation chores.

Keywords: data cleaning, data tidying, relational databases, R.

TIDY DATA

= data structured to facilitate analysis

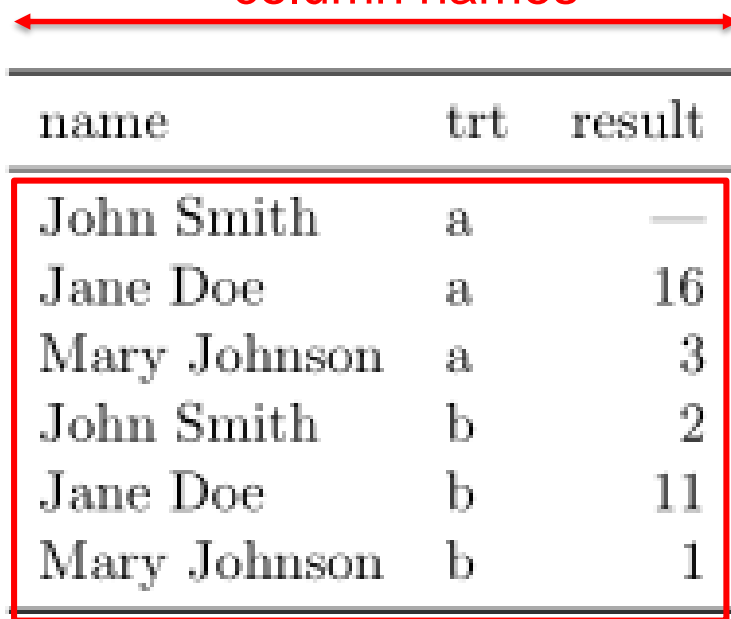

| | | labelled columns | |
|---------------|--------------|------------------|------------|
| | | treatmenta | treatmentb |
| labelled rows | John Smith | — | 2 |
| | Jane Doe | 16 | 11 |
| | Mary Johnson | 3 | 1 |

= data structure

TIDY DATA

Data semantics

variables
= column names

The diagram illustrates data semantics using a table. A horizontal red double-headed arrow above the table header points to the text 'variables = column names'. A vertical red double-headed arrow to the left of the table body points to the text 'observations = rows'. The table itself is enclosed in a red border and contains six rows of data. The first row is the header, and the following five rows represent individual observations.

| name | trt | result |
|--------------|-----|--------|
| John Smith | a | — |
| Jane Doe | a | 16 |
| Mary Johnson | a | 3 |
| John Smith | b | 2 |
| Jane Doe | b | 11 |
| Mary Johnson | b | 1 |

observations
= rows

values

TIDY DATA

- Variables are columns
- Observations are rows
- Each observational unit in one table

In addition: put fixed variables first and then measured variables last

If you order, do so by the first variable

MESSY DATA - EXAMPLES

Column headers = values, not variables

| religion | <\$10k | \$10-20k | \$20-30k | \$30-40k | \$40-50k | \$50-75k |

Tidy Data

Hadley Wickham
RStudio

Abstract

A huge amount of effort is spent cleaning data to get it ready for analysis, but there has been little research on how to make data cleaning as easy and effective as possible. This paper tackles a small, but important, component of data cleaning: data tidying. Tidy datasets are easy to manipulate, model and visualise, and have a specific structure: each variable is a column, each observation is a row, and each type of observational unit is a table. This framework makes it easy to tidy messy datasets because only a small set of tools are needed to deal with a wide range of un-tidy datasets. This structure also makes it easier to develop tidy tools for data analysis, tools that both input and output tidy datasets. The advantages of a consistent data structure and matching tools are demonstrated with a case study free from mundane data manipulation chores.

Keywords: data cleaning, data tidying, relational databases, R.

csvkit is a suite of command-line tools for converting to and working with CSV, the king of tabular file formats.

It is inspired by pdftk, gdal and the original csvcut tool by Joe Germuska and Aaron Bycoffe.

If you need to do more complex data analysis than csvkit can handle, use [agate](#).
